The purpose of this paper was to systematically investigate the influence of acid rain environments on the seismic behaviour of a reinforced concrete (RC) column. Six RC column specimens with shear span ratios of 2.84 were tested under low cyclic reversed loads after being subjected to accelerated corrosion tests in

improve its seismic behavior. Despite these investigations, a review of the literature indicates that after ACI318-14 was published, there have been rare experimental attempts to investigate the various modes of failure and damage states to capture the corresponding performance levels for the reinforced HSC
