HCl turns the litmus red - it doesn't bleach it red. The word 'bleach' is used to show that the colour is being lost, i.e. it is turning white. HOCl is the bleach in the reaction. The reason why it bleaches organic matter probably is due to loss of conjugation because of addition reactions occurring when the H-OCl meets a double bond.

The main use of litmus is to test whether a solution is acidic or basic. Light Blue litmus paper turns red under acidic conditions and red litmus paper turns blue under basic or alkaline conditions, with the color change occurring over the pH range 4.5–8.3 at 25 °C (77 °F). Neutral litmus paper is purple. Litmus can also be prepared as an aqueous solution that functions similarly.
